Document 14 — Character Manager (Expanded Specification)

Document ID: MS-014

Version: 2.0

Status: Expanded Specification

Priority: Critical

Purpose

The Character Manager is responsible for creating, organizing, evolving, and maintaining every character within a project.

Characters are not simply images or illustrations. They are complete creative entities with identities, personalities, histories, appearances, voices, relationships, emotional development, and reusable assets.

Every AI-generated comic panel, animation, storyboard, voice line, or scene must reference the Character Manager to maintain consistency throughout the project.

Objectives

The Character Manager shall:

- Maintain character consistency across the entire project.
 - Store reusable character information.
 - Track visual changes over time.
 - Track personality and emotional development.
 - Connect directly with the Story Bible.
 - Connect with the Asset Library.
 - Support future collaboration.
 - Prevent duplicate character creation.
-

User Stories

As a creator, I want to create a character once and reuse them throughout my project.

As a creator, I want AI to recognize my character even if they wear different clothing or hairstyles.

As a creator, I want emotional changes to influence expressions, poses, and dialogue.

As a creator, I want every version of my character saved so I can return to older designs if necessary.

As a creator, I want AI to suggest improvements while allowing me to make the final decisions.

Character Profile

Every character shall contain:

- Character ID
- Full Name
- Nickname(s)
- Pronouns
- Age
- Birthday
- Height
- Weight
- Species
- Occupation
- Biography
- Personality Traits
- Strengths
- Weaknesses
- Motivations
- Goals
- Relationships
- Voice Profile
- Appearance History
- Outfit Library
- Expression Library
- Pose Library
- Current Story Status

Each Character ID must be unique and never reused, even if two characters share the same name.

Visual Identity

The Character Manager stores:

- Base appearance
- Hair styles
- Hair colors
- Eye colors
- Facial features
- Body proportions
- Clothing collections
- Accessories
- Injuries
- Scars
- Tattoos
- Seasonal outfits
- Alternate costumes

These visual elements are reusable and versioned.

Character Evolution

Characters naturally change throughout a story.

The Character Manager tracks:

- Age progression
- Emotional development
- Personality shifts
- Relationship changes
- Physical appearance changes
- Outfit changes
- Skill progression
- Career changes
- Health status
- Story milestones

Older versions remain available for previous chapters.

Relationship Management

Every character may connect with:

- Family
- Friends
- Rivals
- Enemies
- Mentors
- Organizations
- Teams
- Pets

Relationship strength may evolve over time.

AI Workflow

Whenever AI generates content it shall:

1. Identify every referenced character.
 2. Retrieve Character IDs.
 3. Load current appearance.
 4. Load personality.
 5. Load emotional state.
 6. Load active outfit.
 7. Load relationships.
 8. Check Story Bible.
 9. Generate content.
 10. Validate consistency.
 11. Save approved updates.
-

Database Entities

The Character Manager may use:

- Character
- CharacterVersion
- Outfit
- Expression
- Pose
- Relationship
- VoiceProfile

- CharacterAsset
- CharacterHistory
- CharacterStatus

These entities support long-term consistency and future expansion.

AI Validation

Before approving generated content, Morphic Core should verify:

- Character identity.
- Correct clothing.
- Correct hairstyle.
- Appropriate facial expression.
- Story timeline accuracy.
- Relationship consistency.
- World consistency.
- Emotional consistency.

Potential conflicts should be presented to the creator for review.

UI Components

The Character Manager interface may include:

- Character Grid
 - Character Cards
 - Detailed Profile View
 - Appearance Editor
 - Outfit Manager
 - Expression Library
 - Relationship Graph
 - Voice Settings
 - Character Timeline
 - AI Suggestions Panel
 - Version History
 - Asset Gallery
-

Error Handling

If conflicts occur, the system should:

- Explain the issue clearly.
 - Highlight conflicting information.
 - Suggest possible resolutions.
 - Allow the creator to choose the preferred outcome.
 - Never overwrite approved character data automatically.
-

Performance Requirements

The Character Manager should:

- Support thousands of characters.
 - Load profiles quickly.
 - Search instantly.
 - Handle large asset collections.
 - Cache frequently used information.
 - Synchronize efficiently with Morphic Core.
-

Future Expansion

Future versions may introduce:

- AI-assisted character evolution.
 - Automatic consistency scoring.
 - Facial performance libraries.
 - Motion libraries.
 - Animation rigs.
 - Shared character libraries.
 - Marketplace integration.
 - Cross-project reusable characters.
 - Franchise-level character management.
-

Acceptance Criteria

The Character Manager succeeds when creators can confidently reuse, evolve, and manage characters throughout long-running projects without losing visual, narrative, or emotional consistency.

Key Principle

Characters are not images. They are living creative entities whose identities evolve while remaining consistent throughout the life of a story.
