

Morphic Studio

Document 11 — Authentication & User Identity System

Document ID: MS-011

Version: 1.0

Status: Foundation

Priority: Critical

Purpose

The Authentication & User Identity System is responsible for securely identifying users, protecting their creative work, and providing a personalized experience throughout Morphic Studio.

Authentication is more than signing in. It is the gateway to a creator's personal workspace, Story Bibles, projects, assets, settings, AI preferences, and creative history.

The system must be secure, intuitive, and scalable from Version 1 through future enterprise features.

Vision

Every creator should feel that Morphic Studio is their personal creative workspace.

When they sign in, the platform should immediately restore their projects, preferences, AI settings, recent work, and creative context.

Authentication should feel effortless while maintaining strong security.

Core Principles

The Authentication System shall be:

- Secure by default.
 - Simple for beginners.
 - Fast to access.
 - Privacy-focused.
 - Expandable for future collaboration.
 - Compatible with industry-standard authentication methods.
-

User Account Structure

Each account represents a single creator identity.

Every account contains:

- User Profile
 - Authentication Credentials
 - Account Preferences
 - AI Preferences
 - Dashboard Preferences
 - Story Universes
 - Projects
 - Story Bibles
 - Asset Library
 - Export History
 - Activity History
 - Subscription Information (Future)
 - Team Memberships (Future)
-

Supported Sign-In Methods

Version 1 should support:

- Email and Password
- Google Sign-In

Future versions may support:

- GitHub
- Apple

- Microsoft
 - Enterprise Single Sign-On (SSO)
 - Passkeys
-

Registration Workflow

New users should complete the following steps:

1. Create an account.
2. Verify email address.
3. Choose a display name.
4. Accept terms of service.
5. Complete a short onboarding experience.
6. Create their first project or explore a sample project.

The onboarding process should be optional but highly encouraged.

Sign-In Workflow

When returning users sign in:

1. Authenticate credentials.
2. Verify session.
3. Restore user preferences.
4. Load Dashboard.
5. Resume recent creative activity.
6. Synchronize project data.

The process should feel seamless and quick.

Password Recovery

Users must be able to:

- Request a password reset.
- Receive a secure verification link.
- Create a new password.
- Return to their Dashboard without losing data.

The process should never expose sensitive account information.

User Profile

Each profile should include:

- Display Name
- Username (Future)
- Profile Picture
- Bio (Optional)
- Preferred Language
- Preferred Theme
- Time Zone
- AI Preferences
- Notification Preferences

Users should be able to update this information at any time.

Session Management

The platform should:

- Maintain secure login sessions.
 - Allow users to sign out from individual devices.
 - Support persistent login when appropriate.
 - Automatically expire inactive sessions after a configurable period.
-

Security Principles

The Authentication System shall:

- Encrypt passwords using industry-standard hashing algorithms.
- Use HTTPS for all communication.
- Validate all authentication requests.
- Protect against common web vulnerabilities.
- Limit repeated failed login attempts.
- Log security-related events for auditing.

Sensitive information should never be exposed to the client.

Privacy

Creators own their data.

The platform should clearly communicate:

- What information is collected.
- Why it is collected.
- How it is used.
- How users can export or delete their data.

Privacy should be treated as a core feature rather than an afterthought.

Onboarding Experience

The first-time experience should introduce:

- Dashboard
- Story Bible
- Project Creation
- Character Manager
- Asset Library
- AI Workflow

The goal is to reduce confusion and help creators begin their first project with confidence.

Future Expansion

Future authentication features may include:

- Two-Factor Authentication (2FA)
 - Team Workspaces
 - Shared Organizations
 - Role-Based Permissions
 - Enterprise Authentication
 - Activity Logs
 - Account Recovery Codes
 - Device Management
 - Biometric Authentication
 - Passkeys
-

Success Criteria

The Authentication & User Identity System succeeds when creators can securely access their creative workspace with minimal friction while trusting that their projects, assets, and personal information are protected.

Key Principle

Authentication is not just access to the platform—it is the doorway to each creator's unique creative universe.
