

# Morphic Studio

## Document 06 — Project Brain & Creative Memory Engine

**Document ID:** MS-006

**Version:** 1.0

**Status:** Foundation

---

### Purpose

The Project Brain is the central intelligence layer of every Morphic Studio project.

It does not generate content itself. Instead, it coordinates information, tracks project state, and provides context to every AI task.

Working alongside it is the Creative Memory Engine, which preserves not only facts but also creative intent, ensuring that AI-assisted work remains consistent over the life of the project.

---

### Core Responsibilities

The Project Brain shall:

- Maintain the current state of the project.
  - Coordinate communication between major systems.
  - Provide context to AI modules.
  - Track active workflows.
  - Manage long-running AI tasks.
  - Synchronize changes across the platform.
- 

### Connected Systems

The Project Brain communicates with:

- Story Bible

- Project DNA
- Creative Journal
- Creative Timeline
- Asset Library
- Morphic Core
- AI Task Bus

It never becomes the source of truth for these systems; instead, it acts as the coordinator that knows how they fit together.

---

## Creative Memory Engine

The Creative Memory Engine extends beyond storing facts.

It captures:

- Creative intent.
- Design decisions.
- Narrative goals.
- Visual direction.
- Character evolution.
- Artistic consistency.

For example:

- A character's clothing changes because six months passed in the story.
- A city gradually becomes darker as conflict escalates.
- Camera framing shifts from wide to close-up during emotionally intense scenes.

The engine records *why* these changes occur so future AI generations preserve the creator's vision.

---

## Memory Layers

The Creative Memory Engine operates on four layers:

1. **Facts** (Story Bible)
2. **Creative Identity** (Project DNA)
3. **Decision Rationale** (Creative Journal)
4. **Project History** (Creative Timeline)

Together, these layers provide the AI with both context and purpose.

---

# Synchronization

Whenever approved changes occur, the Project Brain updates the relevant systems and keeps them synchronized.

Conflicting updates trigger review rather than automatic resolution.

---

# Future Evolution

Future versions may include:

- Semantic search across projects.
  - Cross-project memory.
  - Franchise-wide knowledge.
  - AI-assisted continuity analysis.
  - Personalized creative recommendations.
- 

# Success Criteria

The Project Brain succeeds when a creator can leave a project for months, return, and continue working with the AI as though no time has passed.
