

Morphic Studio

Document 10 — Dashboard & Creative Command Center

Document ID: MS-010

Version: 1.0

Status: Foundation

Priority: Critical

Purpose

The Dashboard is the central command center of Morphic Studio.

It is the first screen creators see after logging in and serves as the starting point for every creative workflow.

Rather than simply displaying information, the Dashboard should help creators quickly understand the status of their projects, resume work, access important tools, and receive meaningful insights from the AI.

The Dashboard should reduce friction and help users spend less time navigating and more time creating.

Design Goals

The Dashboard should feel:

- Professional
- Fast
- Calm
- Creative
- Organized
- Intelligent
- Personalized
- Welcoming

It should never feel cluttered or overwhelming.

Dashboard Objectives

The Dashboard should allow users to:

- View all projects.
- Resume unfinished work.
- Create a new project.
- Search projects and assets.
- Monitor AI tasks.
- Review notifications.
- Access recent assets.
- View creative statistics.
- Manage account settings.
- Navigate to every major module.

Dashboard Layout

The Dashboard consists of five primary regions:

1. Global Navigation
2. Sidebar Navigation
3. Main Workspace
4. AI Assistant Panel
5. Status & Notifications Area

Every future dashboard enhancement should fit within this structure.

Global Navigation

The top navigation bar provides access to:

- Morphic Studio logo
- Universal search
- Notifications
- AI task indicator
- User profile
- Settings
- Help
- Workspace switcher (future feature)

The navigation bar remains visible at all times.

Sidebar Navigation

The left sidebar contains:

- Dashboard
- Projects
- Story Bible
- Characters
- Asset Library
- Comic Studio
- Animation Studio
- Motion Comic Studio
- AI Tools
- Export Center
- Templates
- Settings

Future modules can be added without redesigning the sidebar.

Main Workspace

The central workspace is dynamic.

Depending on the creator's activity, it may display:

- Recent projects
- Continue working
- Project recommendations
- AI suggestions
- Recently generated assets
- Favorite projects
- Learning resources
- Quick actions

The workspace should prioritize relevance over quantity.

Quick Actions

The Dashboard should prominently feature actions such as:

- Create New Project

- Upload Script
- Import Assets
- Open Story Bible
- Continue Last Project
- Generate New Character
- Start Comic
- Start Animation

These actions should be accessible with one click.

Project Cards

Each project card should display:

- Project title
- Thumbnail
- Current workflow stage
- Last edited date
- Progress indicator
- Project type
- AI status
- Favorite indicator

Hovering over a project reveals additional actions such as rename, duplicate, archive, or delete.

AI Assistant Panel

The AI Assistant Panel provides real-time assistance.

It may display:

- Suggested next steps
- Creative recommendations
- Continuity warnings
- Missing assets
- Pending AI tasks
- Production tips

The assistant should be helpful without interrupting the creator's workflow.

Notifications

Notifications are grouped into categories:

- System
- AI
- Project
- Collaboration (future)
- Updates

Each notification should clearly explain:

- What happened
 - Why it matters
 - Recommended action
-

Search

Universal Search should support:

- Projects
- Characters
- Assets
- Locations
- Story elements
- AI tasks
- Templates

Results should appear instantly and include filters.

Dashboard Widgets

Widgets may include:

- Active Projects
- AI Task Queue
- Recent Assets
- Creative Progress
- Storage Usage
- Favorite Characters
- Upcoming Milestones
- Recent Exports

- Productivity Insights

Users should eventually be able to customize which widgets appear.

Empty States

When a new user has no projects, the Dashboard should guide them with:

- Welcome message
- Create first project button
- Quick tutorial
- Sample project
- Documentation links

The interface should encourage exploration rather than feeling empty.

Personalization

Over time, the Dashboard should adapt to the creator by prioritizing:

- Frequently used tools
- Favorite projects
- Common workflows
- Recently accessed assets

The creator always remains in control of personalization settings.

Performance

The Dashboard should:

- Load quickly.
 - Cache frequently used information.
 - Refresh AI status in the background.
 - Remain responsive during long AI tasks.
-

Future Expansion

Future versions may include:

- Team workspaces
 - Collaboration feed
 - AI production analytics
 - Cloud rendering status
 - Marketplace access
 - Plugin management
 - Community templates
 - Creator achievements
-

Success Criteria

The Dashboard succeeds when a creator can log in, immediately understand the status of their creative work, and continue building their project with minimal effort.

Key Principle

The Dashboard is not just a homepage. It is the creator's creative command center.
