

Morphic Studio

Document 16 — World Builder (Expanded Specification)

Document ID: MS-016

Version: 2.0

Status: Expanded Specification

Priority: Critical

Purpose

The World Builder is responsible for creating, organizing, managing, and evolving the fictional universes that exist within Morphic Studio.

A world is far more than a map or a collection of locations. It is a living system composed of geography, history, cultures, governments, economies, technologies, belief systems, organizations, ecosystems, and the rules that govern reality.

Every AI generation process must reference the World Builder to ensure that stories remain logically and visually consistent.

Vision

Creators should be able to build worlds that feel alive.

Whether the setting is:

- A modern city
- A medieval kingdom
- A futuristic galaxy
- A magical universe
- A post-apocalyptic wasteland
- A school campus
- A single apartment

...the World Builder should provide enough structure for AI to understand not only **where** a story happens, but **why** that world behaves the way it does.

Core Principles

The World Builder shall be:

- Persistent
 - Expandable
 - Logically consistent
 - AI-readable
 - Modular
 - Reusable
 - Searchable
 - Creator-controlled
 - Timeline-aware
-

Objectives

The World Builder shall:

- Store every world used in a project.
 - Maintain consistency across chapters and episodes.
 - Record the rules that govern each world.
 - Connect locations, characters, factions, and events.
 - Provide context to every AI generation task.
 - Allow worlds to evolve over time without losing historical accuracy.
-

What Is a World?

A world is a structured collection of interconnected elements.

A world may contain:

- Continents
- Countries
- Cities
- Villages
- Buildings
- Rooms
- Landscapes

- Kingdoms
- Planets
- Galaxies
- Dimensions
- Historical eras
- Political systems
- Religions
- Magic systems
- Scientific laws
- Social customs
- Wildlife
- Climate
- Natural resources

The complexity depends entirely on the creator's needs.

World Hierarchy

Example hierarchy:

Universe

↓

Galaxy

↓

Solar System

↓

Planet

↓

Continent

↓

Country

↓

State / Province

City

District

Building

Floor

Room

Not every project requires every level, but the structure should support them.

World Profile

Each world should contain:

- World ID
- Name
- Description
- Genre
- Creation Date
- Timeline
- Current Era
- Technology Level
- Magic Level
- Scientific Rules
- Cultural Overview
- Government
- Economy
- Religion
- Climate
- Population

- Languages
 - Calendar System
 - Measurement System
 - Timekeeping
 - Map References
 - Creator Notes
-

Location Management

Every location should include:

- Location ID
- Name
- Type
- Description
- Parent Location
- Coordinates (optional)
- Environment
- Architecture
- Climate
- Population
- Security Level
- Associated Characters
- Associated Organizations
- Related Assets

Locations are reusable and versioned.

Organizations & Factions

The World Builder shall support:

- Governments
- Guilds
- Schools
- Companies
- Military Groups
- Religious Orders
- Criminal Organizations
- Sports Teams
- Secret Societies
- Political Parties
- Research Institutes

Each organization includes leadership, goals, members, influence, and history.

World Rules

Creators define the laws that govern reality.

Examples:

- Magic exists.
- Time travel is impossible.
- Gravity differs by planet.
- Teleportation requires energy.
- Dragons are extinct.
- AI is illegal.
- Electricity does not exist.

Every AI generation must respect these rules.

History & Timeline

The World Builder maintains a historical record of:

- Ancient events
- Wars
- Discoveries
- Revolutions
- Natural disasters
- Political changes
- Technological breakthroughs
- Major story events

This allows AI to understand cause and effect across time.

AI Workflow

Before generating content, Morpheic Core shall:

1. Identify the active world.
2. Load applicable world rules.
3. Retrieve relevant locations.
4. Retrieve organizations.

5. Check timeline events.
 6. Validate against Story Bible.
 7. Generate content.
 8. Record approved changes.
-

User Stories

As a creator, I want AI to remember my world's rules so I don't have to repeat them.

As a creator, I want locations to remain visually consistent.

As a creator, I want my world's history to influence future events.

As a creator, I want to reuse the same world across multiple projects.

Functional Requirements

The World Builder shall allow users to:

- Create worlds.
 - Edit worlds.
 - Archive worlds.
 - Duplicate worlds.
 - Import worlds.
 - Export worlds.
 - Create locations.
 - Link locations.
 - Create organizations.
 - Define rules.
 - Build timelines.
 - Attach assets.
 - Connect Story Bible entries.
-

Non-Functional Requirements

The World Builder should:

- Support extremely large worlds.
- Load efficiently.
- Synchronize automatically.

- Scale to franchise-sized projects.
 - Maintain fast search performance.
 - Cache frequently accessed data.
-

Database Entities

Primary entities include:

- World
 - WorldVersion
 - Location
 - Organization
 - Government
 - TimelineEvent
 - WorldRule
 - Map
 - Calendar
 - Language
 - Culture
 - ClimateProfile
-

API Considerations

Potential endpoints include:

- Create World
 - Retrieve World
 - Update World
 - Delete World
 - Create Location
 - Search Locations
 - Retrieve Timeline
 - Manage Organizations
 - Export World
-

Error Handling

If AI attempts to violate world rules:

- Explain the conflict.
- Highlight the violated rule.

- Recommend alternatives.
 - Allow creator override if desired.
-

Future Expansion

Future versions may include:

- Interactive maps.
 - AI-generated geography.
 - Procedural ecosystems.
 - Dynamic weather systems.
 - Economy simulation.
 - Political simulation.
 - Historical event generator.
 - World templates.
 - Shared universe support.
 - Cross-project world libraries.
-

Acceptance Criteria

The World Builder succeeds when creators can design complex fictional universes that remain internally consistent across every chapter, comic, animation, and AI-assisted generation.

Key Principle

A world is more than a setting—it is a living system. Every story, character, and event exists because of the world that surrounds it, and the AI must understand that system before it creates anything.
